Artificial neural networks (ANN)

- universal function approximator
- intuition: neurons in successive layers encode useful features

Artificial neural networks and brain analogy – a neuron

- more than a hundred types of neurons in brain

Artificial neuron

The brain analogy is far from realistic: a neuron cell is highly complex, and so are interconnections.

Perceptron

Activation functions

- examples: step function, sigmoid (logistic)

Activation functions

- ReLU (rectified linear unit)

$$f(x) = \max(0, x)$$

- softplus / approximation of ReLU with continuous derivation

$$f(x) = \ln(1+e^x)$$

- many others

Learning: error backpropagation

- a single neuron is weak
- a network of neurons can approximate any continuous function
- deep neural network: more than one hidden level

- learning: error backpropagation

Backpropagation learning algorithm for NN

- Backpropagation: A neural network learning algorithm
- Started by psychologists and neurobiologists to develop and test computational analogues of neurons
- During the learning phase, the network learns by adjusting the weights so as to be able to predict the correct class label of the input tuples
- Also referred to as connectionist learning due to the connections between units

How a multi-layer feed-forward NN works?

- The **inputs** to the network correspond to the attributes measured for each training tuple
- Inputs are fed simultaneously into the units making up the **input layer**
- They are then weighted and fed simultaneously to a **hidden layer**
- The number of hidden layers is arbitrary; if more than 1 hidden layer is used, the network is called deep neural network
- The weighted outputs of the last hidden layer are input to units making up the **output layer**, which emits the network's prediction
- The network is **feed-forward** if none of the weights cycles back to an input unit or to an output unit of a previous layer
- If we have backwards connections the network is called recurrent neural network
- From a statistical point of view, networks perform **nonlinear regression**: Given enough hidden units and enough training samples, they can closely approximate any function

Deep learning =

deep neural networks + large data sets +
GPU

(+many new ideas)

Input

Hidden layer(s)

Output

Why nonlinear activation function?

- The product of two linear transformations is itself a linear transformation.
- What is a derivative of a sigmoid?

Feed-Forward Network

- Values are propagated from input through the network till the output layer which returns the prediction

Feed-Forward Networks

Feed-Forward Networks

Feed-Forward Networks

Feed-Forward Networks

Feed-Forward Networks

Softmax

- normalizes the output scores to be a probability distribution (values between 0 and 1, the sum is 1)

$$y_i = \frac{e^{z_i}}{\sum_{j \in \text{group}} e^{z_j}}$$

$$\frac{\partial y_i}{\partial z_i} = y_i (1 - y_i)$$

Criterion function

- together with softmax we frequently use cross entropy as cost function C

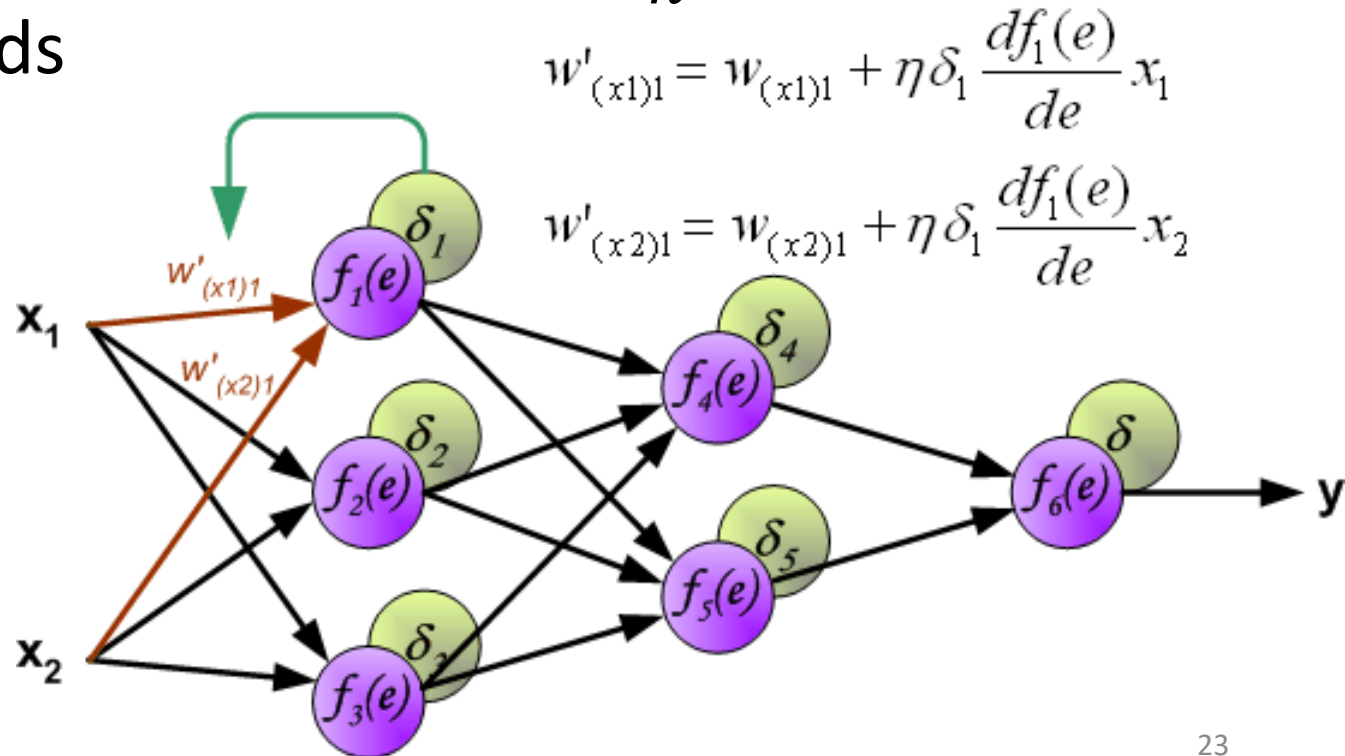

$$C = - \sum_j t_j \log y_j$$

target value

$$\frac{\partial C}{\partial z_i} = \sum_j \frac{\partial C}{\partial y_j} \frac{\partial y_j}{\partial z_i} = y_i - t_i$$

Learning with error backpropagation

- Backpropagation
- randomly initialize parameters (weights)
- compute error on the output
- compute contributions to error, δ_n , on each step backwards
- gradient
- step
- iteratively
- batch
- minibatch

Error Backpropagation

- We will do gradient descent on the whole network.
- Training will proceed from the last layer to the first.

Error Backpropagation

- Introduce variables over the neural network

$$\vec{\theta} = \{w_{ij}, w_{jk}, w_{kl}\}$$

Error Backpropagation

$$\vec{\theta} = \{w_{ij}, w_{jk}, w_{kl}\}$$

- Introduce variables over the neural network
 - Distinguish the input and output of each node

Error Backpropagation

$$\vec{\theta} = \{w_{ij}, w_{jk}, w_{kl}\}$$

$$a_j = \sum_i w_{ij} z_i \quad a_k = \sum_j w_{jk} z_j \quad a_l = \sum_k w_{kl} z_k$$

$$z_j = g(a_j)$$

$$z_k = g(a_k)$$

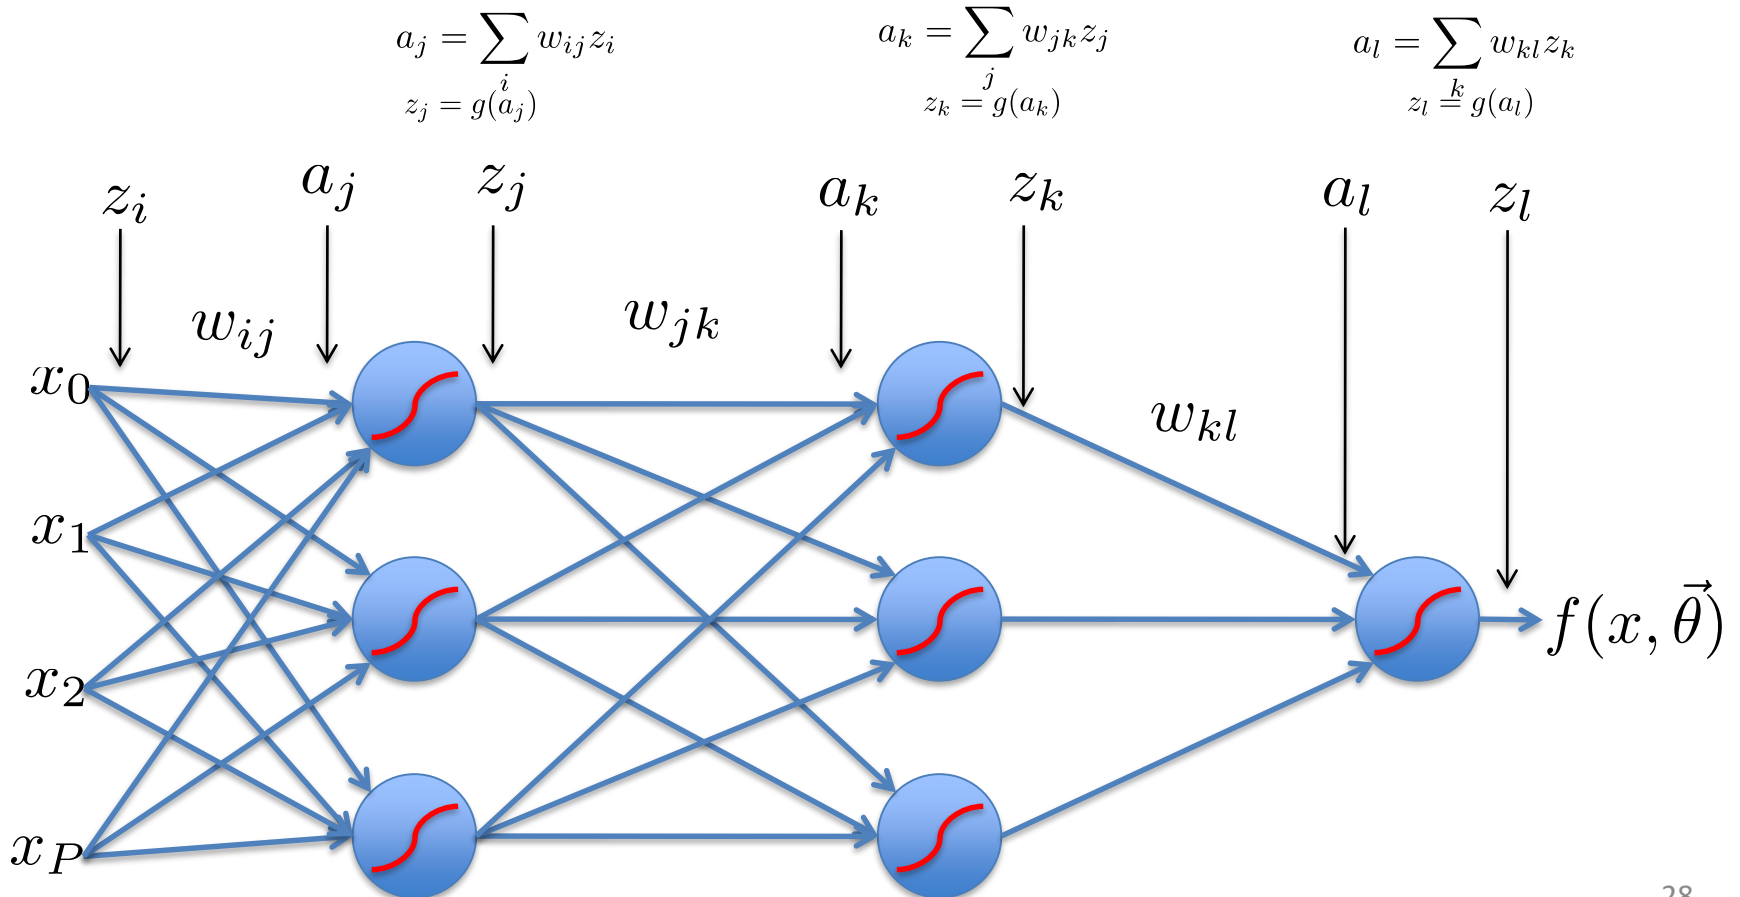

$$z_l = g(a_l)$$

Error Backpropagation

$$\vec{\theta} = \{w_{ij}, w_{jk}, w_{kl}\}$$

Training: Take the gradient of the last component and iterate backwards

Error Backpropagation

$$R(\theta) = \frac{1}{N} \sum_{n=0}^N L(y_n - f(x_n))$$

Empirical Risk Function

$$= \frac{1}{N} \sum_{n=0}^N \frac{1}{2} (y_n - f(x_n))^2$$

$$= \frac{1}{N} \sum_{n=0}^N \frac{1}{2} \left(y_n - g \left(\sum_k w_{kl} g \left(\sum_j w_{jk} g \left(\sum_i w_{ij} x_{n,i} \right) \right) \right) \right)^2$$

Error Backpropagation

Optimize last layer weights w_{kl}

$$L_n = \frac{1}{2} (y_n - f(x_n))^2$$

$$\frac{\partial R}{\partial w_{kl}} = \frac{1}{N} \sum_n \left[\frac{\partial L_n}{\partial a_{l,n}} \right] \left[\frac{\partial a_{l,n}}{\partial w_{kl}} \right]$$

Calculus chain rule

Error Backpropagation

Optimize last layer weights w_{kl}

$$L_n = \frac{1}{2} (y_n - f(x_n))^2$$

$$\frac{\partial R}{\partial w_{kl}} = \frac{1}{N} \sum_n \left[\frac{\partial L_n}{\partial a_{l,n}} \right] \left[\frac{\partial a_{l,n}}{\partial w_{kl}} \right]$$

Calculus chain rule

$$\frac{\partial R}{\partial w_{kl}} = \frac{1}{N} \sum_n \left[\frac{\partial \frac{1}{2} (y_n - g(a_{l,n}))^2}{\partial a_{l,n}} \right] \left[\frac{\partial a_{l,n}}{\partial w_{kl}} \right]$$

Error Backpropagation

Optimize last layer weights w_{kl}

$$L_n = \frac{1}{2} (y_n - f(x_n))^2$$

$$\frac{\partial R}{\partial w_{kl}} = \frac{1}{N} \sum_n \left[\frac{\partial L_n}{\partial a_{l,n}} \right] \left[\frac{\partial a_{l,n}}{\partial w_{kl}} \right]$$

Calculus chain rule

$$\frac{\partial R}{\partial w_{kl}} = \frac{1}{N} \sum_n \left[\frac{\partial \frac{1}{2} (y_n - g(a_{l,n}))^2}{\partial a_{l,n}} \right] \left[\frac{\partial z_{k,n} w_{kl}}{\partial w_{kl}} \right]$$

Error Backpropagation

Optimize last layer weights w_{kl}

$$L_n = \frac{1}{2} (y_n - f(x_n))^2$$

$$\frac{\partial R}{\partial w_{kl}} = \frac{1}{N} \sum_n \left[\frac{\partial L_n}{\partial a_{l,n}} \right] \left[\frac{\partial a_{l,n}}{\partial w_{kl}} \right]$$

Calculus chain rule

$$\frac{\partial R}{\partial w_{kl}} = \frac{1}{N} \sum_n \left[\frac{\partial \frac{1}{2} (y_n - g(a_{l,n}))^2}{\partial a_{l,n}} \right] \left[\frac{\partial z_{k,n} w_{kl}}{\partial w_{kl}} \right] = \frac{1}{N} \sum_n [-(y_n - z_{l,n}) g'(a_{l,n})] z_{k,n}$$

Error Backpropagation

Optimize last layer weights w_{kl}

$$L_n = \frac{1}{2} (y_n - f(x_n))^2$$

$$\frac{\partial R}{\partial w_{kl}} = \frac{1}{N} \sum_n \left[\frac{\partial L_n}{\partial a_{l,n}} \right] \left[\frac{\partial a_{l,n}}{\partial w_{kl}} \right]$$

Calculus chain rule

$$\frac{\partial R}{\partial w_{kl}} = \frac{1}{N} \sum_n \left[\frac{\partial \frac{1}{2} (y_n - g(a_{l,n}))^2}{\partial a_{l,n}} \right] \left[\frac{\partial z_{k,n} w_{kl}}{\partial w_{kl}} \right] = \frac{1}{N} \sum_n [-(y_n - z_{l,n}) g'(a_{l,n})] z_{k,n}$$

$$= \frac{1}{N} \sum_n \delta_{l,n} z_{k,n}$$

Error Backpropagation

Optimize last hidden weights w_{jk}

$$\frac{\partial R}{\partial w_{kl}} = \frac{1}{N} \sum_n \delta_{l,n} z_{k,n}$$

$$\frac{\partial R}{\partial w_{jk}} = \frac{1}{N} \sum_n \left[\frac{\partial L_n}{\partial a_{k,n}} \right] \left[\frac{\partial a_{k,n}}{\partial w_{jk}} \right]$$

Error Backpropagation

Optimize last hidden weights w_{jk}

$$\frac{\partial R}{\partial w_{kl}} = \frac{1}{N} \sum_n \delta_{l,n} z_{k,n}$$

$$\frac{\partial R}{\partial w_{jk}} = \frac{1}{N} \sum_n \left[\sum_l \frac{\partial L_n}{\partial a_{l,n}} \frac{\partial a_{l,n}}{\partial a_{k,n}} \right] \left[\frac{\partial a_{k,n}}{\partial w_{jk}} \right]$$

Multivariate chain rule

Error Backpropagation

Optimize last hidden weights w_{jk}

$$\frac{\partial R}{\partial w_{kl}} = \frac{1}{N} \sum_n \delta_{l,n} z_{k,n}$$

$$\frac{\partial R}{\partial w_{jk}} = \frac{1}{N} \sum_n \left[\sum_l \frac{\partial L_n}{\partial a_{l,n}} \frac{\partial a_{l,n}}{\partial a_{k,n}} \right] \left[\frac{\partial a_{k,n}}{\partial w_{jk}} \right]$$

Multivariate chain rule

$$\frac{\partial R}{\partial w_{jk}} = \frac{1}{N} \sum_n \left[\sum_l \delta_l \frac{\partial a_{l,n}}{\partial a_{k,n}} \right] [z_{j,n}]$$

Error Backpropagation

Optimize last hidden weights w_{jk}

$$\frac{\partial R}{\partial w_{kl}} = \frac{1}{N} \sum_n \delta_{l,n} z_{k,n}$$

$$\frac{\partial R}{\partial w_{jk}} = \frac{1}{N} \sum_n \left[\sum_l \frac{\partial L_n}{\partial a_{l,n}} \frac{\partial a_{l,n}}{\partial a_{k,n}} \right] \left[\frac{\partial a_{k,n}}{\partial w_{jk}} \right]$$

Multivariate chain rule

$$\frac{\partial R}{\partial w_{jk}} = \frac{1}{N} \sum_n \left[\sum_l \delta_l \frac{\partial a_{l,n}}{\partial a_{k,n}} \right] [z_{j,n}]$$

$$a_l = \sum_k w_{kl} g(a_k)$$

Error Backpropagation

Optimize last hidden weights w_{jk}

$$\frac{\partial R}{\partial w_{kl}} = \frac{1}{N} \sum_n \delta_{l,n} z_{k,n}$$

$$\frac{\partial R}{\partial w_{jk}} = \frac{1}{N} \sum_n \left[\sum_l \frac{\partial L_n}{\partial a_{l,n}} \frac{\partial a_{l,n}}{\partial a_{k,n}} \right] \left[\frac{\partial a_{k,n}}{\partial w_{jk}} \right]$$

Multivariate chain rule

$$\frac{\partial R}{\partial w_{jk}} = \frac{1}{N} \sum_n \left[\sum_l \delta_{l,n} w_{kl} g'(a_{k,n}) \right] [z_{j,n}] = \frac{1}{N} \sum_n [\delta_{k,n}] [z_{j,n}]$$

$$a_l = \sum_k w_{kl} g(a_k)$$

Error Backpropagation

Repeat for all previous layers

$$\frac{\partial R}{\partial w_{kl}} = \frac{1}{N} \sum_n \left[\frac{\partial L_n}{\partial a_{l,n}} \right] \left[\frac{\partial a_{l,n}}{\partial w_{kl}} \right] = \frac{1}{N} \sum_n [-(y_n - z_{l,n})g'(a_{l,n})] z_{k,n} = \frac{1}{N} \sum_n \delta_{l,n} z_{k,n}$$

$$\frac{\partial R}{\partial w_{jk}} = \frac{1}{N} \sum_n \left[\frac{\partial L_n}{\partial a_{k,n}} \right] \left[\frac{\partial a_{k,n}}{\partial w_{jk}} \right] = \frac{1}{N} \sum_n \left[\sum_l \delta_{l,n} w_{kl} g'(a_{k,n}) \right] z_{j,n} = \frac{1}{N} \sum_n \delta_{k,n} z_{j,n}$$

$$\frac{\partial R}{\partial w_{ij}} = \frac{1}{N} \sum_n \left[\frac{\partial L_n}{\partial a_{j,n}} \right] \left[\frac{\partial a_{j,n}}{\partial w_{ij}} \right] = \frac{1}{N} \sum_n \left[\sum_k \delta_{k,n} w_{jk} g'(a_{j,n}) \right] z_{i,n} = \frac{1}{N} \sum_n \delta_{j,n} z_{i,n}$$

Error Backpropagation

Now that we have well defined gradients for each parameter, update using Gradient Descent

$$w_{ij}^{t+1} = w_{ij}^t - \eta \frac{\partial R}{\partial w_{ij}}$$

$$w_{jk}^{t+1} = w_{jk}^t - \eta \frac{\partial R}{\partial w_{jk}}$$

$$w_{kl}^{t+1} = w_{kl}^t - \eta \frac{\partial R}{\partial w_{kl}}$$

Error Back-propagation

- Error backpropagation unravels the multivariate chain rule and solves the gradient for each partial component separately.
- The target values for each layer come from the next layer.
- This feeds the errors back along the network.

Backpropagation algorithm

- Iteratively process a set of training tuples & compare the network's prediction with the actual known target value
- For each training tuple, the weights are modified to **minimize the mean squared error** between the network's prediction and the actual target value
- Modifications are made in the “**backwards**” direction: from the output layer, through each hidden layer down to the first hidden layer, hence “**backpropagation**”
- Steps
 - Initialize weights to small random numbers, associated with biases
 - Propagate the inputs forward (by applying activation function)
 - Backpropagate the error (by updating weights and biases)
 - Terminating condition (when error is very small, etc.)

Defining a network topology

- Decide the network topology: Specify # of units in the *input layer*, # of *hidden layers* (if > 1), # of units in *each hidden layer*, and # of units in the *output layer*
- Normalize the input values for each attribute measured in the training tuples to [0.0—1.0]
- One input unit per domain value, each initialized to 0
- Output, if for classification and more than two classes, one output unit per class is used
- Once a network has been trained and its accuracy is still unacceptable, repeat the training process with a *different network topology* or a *different set of initial weights*

Neural network as a classifier

- Weakness
 - Long training time
 - Require a number of parameters typically best determined empirically, e.g., the network topology or “structure.”
 - Poor interpretability: difficult to interpret the symbolic meaning behind the learned weights and of “hidden units” in the network
- Strength
 - High tolerance to noisy data
 - Ability to classify untrained patterns
 - Well-suited for continuous-valued inputs *and outputs*
 - Successful on an array of real-world data, e.g., hand-written letters
 - Algorithms are inherently parallel
 - Techniques exist for the extraction of explanations from trained neural networks

Efficiency

- Efficiency of backpropagation: Each epoch (one iteration through the training set) takes $O(|D| * w)$, with $|D|$ tuples and w weights, but # of epochs can be large (e.g, exponential to n , the number of inputs), in worst case

Interpretation of hidden layers

- What are the hidden layers doing?!
- Feature Extraction
- The non-linearities in the feature extraction can make interpretation of the hidden layers very difficult.
- This leads to Neural Networks being treated as **black boxes**.

Deep learning = learning of hierarchical representation

Feature visualization of convolutional net trained on ImageNet from [Zeiler & Fergus 2013]

Overfitting and model complexity

- which curve is more plausible given the data?
- overfitting
- neural nets are especially prone to overfitting
- why?

Approaches to prevent overfitting

- Weight-decay
- Weight-sharing
- Early stopping
- Model averaging
- Bayesian fitting of neural nets
- Dropout
- Generative pre-training
- etc.

Deep learning successes
