

Redukcija

- predpostavimo: - vektor dolžine 16 pri katerem računamo vse uglebove elemente
- imamo na vfo 16 učtr

a_0	a_1	a_2	a_3	a_4	a_5	a_6	a_7	a_8	a_9	a_{10}	a_{11}	a_{12}	a_{13}	a_{14}	a_{15}
-------	-------	-------	-------	-------	-------	-------	-------	-------	-------	----------	----------	----------	----------	----------	----------

Korak 1
→ 8 učtr

a_0	a_1	a_2	a_3	a_4	a_5	a_6	a_7								
-------	-------	-------	-------	-------	-------	-------	-------	--	--	--	--	--	--	--	--

PREPRAVA
Korak 2
4 učtr

a_0	a_1	a_2	a_3	a_4	a_5	a_6	a_7								
-------	-------	-------	-------	-------	-------	-------	-------	--	--	--	--	--	--	--	--

$a_2 + a_{11} + a_2 + a_{15}$

$a_2 + a_{10} + a_6 + a_{14}$

$a_7 + a_{15}$

$a_6 + a_{14}$

Upokvitre:

→ potrebujemo 4 zaporedne faze za sesteti 16 elementov, namesto 16 faz

→ v splošnem: $\log N$ faz za sesteti N elementov

→ viti pri sestevanju sodelujejo in jih je $\log N$ faz v vsaki polmaji

→ potrebujemo t.i. PREPRAVA med fazi

←
toda pri programu, želi se monito vse
viti početi preden nadefinirajo

Kako implementiramo prepreko?

1. NAIVNO : ena ključavnica in en števec

```
stevec = 0; nit;
```

nit
↓
lock(k);
stevec = -1;
unlock(k);

while (stevec > 0) { } PREPREKA

Totava: tako prepreko ni "re-usable"

Implementacyi redukcije:

$i = \text{NELEMENTS} / 2;$

while ($i \neq 0$) {

if ($\text{myID} < i$) {

$a[\text{myID}] = a[\text{myID}] + a[\text{myID} + i]$

$i = i / 2;$ → to one part of the array

PREPRAKA();

}

preprako se las ponovno uporedjuje u
vred. Hersony ⇒ vrazu

2. Posleus :

Lock (k)

```
counter --;
```

```
if (counter == 0) { → to upolovi  
saduyin nif
```

```
    counter = NTHREADS;  
    semafor = GREEN;  
    unlock(e);  
}
```

```
else {
```

```
    unlock(e);
```

```
    while (semafor == RED) {}
```

```
}
```

MANJKA: moramo resetirati / ponastaviti
semafor!

3. poslus :

LOCK (K1)

counter --;

if (counter == 0) // to vidi today?

counter = NTHREADS;

semaphor = green;

UNLOCK (K1)

}

else {

UNLOCK (K1)

while (semaphor == red) { }

}

// PONAŠTAVI SEMAFOR:

while (semaphor == green) {

LOCK (K2)

if (semaphor == green) {

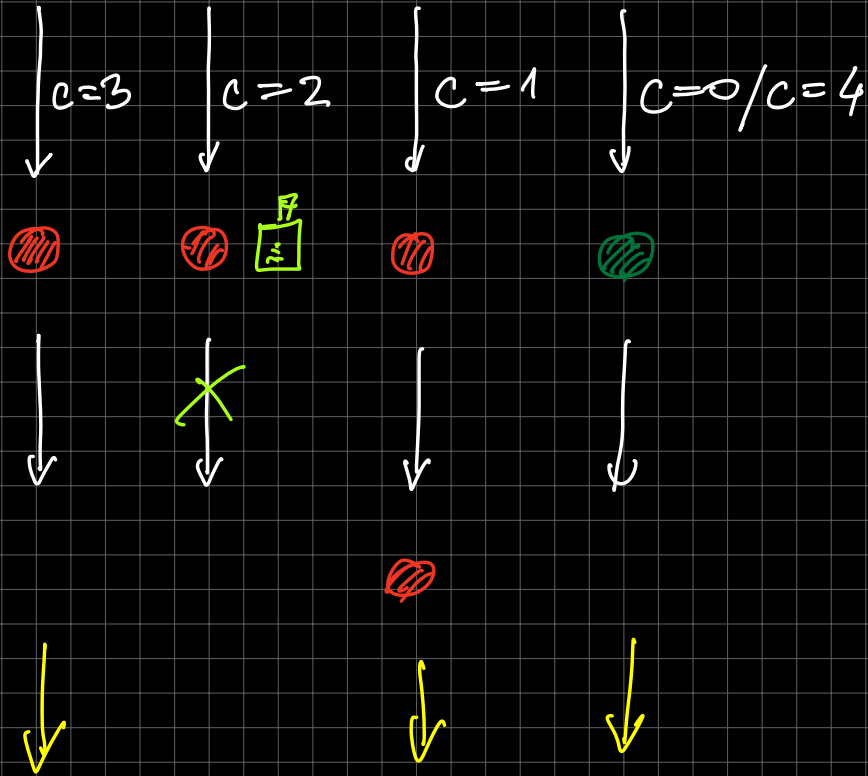

semaphor = red;

UNLOCK (K2)

}

TEZANA:

$c = 4;$

potrebujemo nov itree, sistem de
proprietati, de la unu indivizibile
zeleuo luc

Lock(m1)

counter --;

if (counter == 0) {

counter = NTHREADS;

semaph = green;

videl ++; // hoto, ki piipala relung
jo ki hnd videlo

UNLOCK(m1)

}

else {

UNLOCK(m1)

while (semaph == red) { }

LOCK(m3)

videl ++;

UNLOCK(m3)

}

while (semaph == green) {

LOCK(m2)

if (semaph == green && videl == NTHREADS)

semaph = red

videl = 0;

}

UNLOCK(m2)

}
